

ABSTRACT

The project named as “Hire and build” deals with the perfect utilization of equipment. This will help the customers (who would like to involve construction activities) search the resources and facility to rent equipment. The registered suppliers can participate in the renting process. Handling resources manually is impractical so we have to develop a system. This will easily schedule, track and maintain the equipment. There will be an administrator login which is accessed by the admin who has permission to control, the supplier. Admin can put equipment list for supplier and based on that supplier can register his stock into the system. And the customer can register into the system and he can participate in the bidding process. The booking process is fully automated.

The functions are performed by customers and suppliers. They can register to this website and join this company only after the approval of admin.

This system helps the peoples who are willing to involve any construction activities without equipments they can use this website and get the equipment as minimum rent with minimum distance.
